DATABASECHANGELOG_DETAILS is a view that consolidates information from the DATABASECHANGELOG and DATABASECHANGELOG_ACTIONS tables.

| DATABASECHANGELOG_ACTIONS | | | | | | | |
|---------------------------|--------------------|----|----------|--------------------|-----------|------------------|-------------------|
| | | id | sequence | sql | sxml | author | filename |
| 1 | f02ae6a5d04c968... | | 0 | CREATE TABLE "M... | (null) | (GARY)-Generated | may2018_table.xml |
| 2 | 708012af706c7da... | | | CREATE TABLE "E... | (null) | (GARY)-Generated | emps_table.xml |
| 3 | f02ae6a5d04c968... | | | --skipped | --skipped | (GARY)-Generated | may2018_table.xml |

Emp table created with
thousands of record on Sunday

| Emp id | First_name | Last_name | Dept id | Salary |
|--------|------------|-----------|---------|--------|
| 100 | Alan | Bell | 10 | 4000 |
| 101 | Ben | Pollock | 10 | 3500 |
| 102 | Chris | Ryan | 12 | 4250 |
| ... | | | | |
| 901670 | Brian | Mox | 12 | |

Liquibase and SQLcl

DATABASECHANGELOG_DETAILS is a view that consolidates information from the DATABASECHANGELOG and DATABASECHANGELOG_ACTIONS tables.

| DATABASECHANGELOG_ACTIONS | | | | | | |

SQLcl and Liquibase: APEX

```
SQL> lb genobject -type apex -applicationid 101
```

Creates a single f101.xml file for your application

```
SQL> lb genobject -type apex -applicationid 101 -split
```

Creates multiple folders/files per component and an install file (like with the database)

NOTE: Liquibase will only update the new/altered files when exporting so that your repository only reflects the changes.

Important flags for change management:

```
-skipExportDate -expOriginalIds -split
```

```
SQL> lb update -changelog f101.xml
```

To install the single file

```
SQL> lb update -changelog controller.xml
```

To install multiple files

Create a single file

SQLcl and Liquibase: APEX

```
SQL> lb genobject -type apex -applicationid 101
```

Creates a single f101.xml file for your application

```
SQL> lb genobject -type apex -applicationid 101 -split
```

Creates multiple folders/files per component and an install file (like with the database)

NOTE: Liquibase will only update the new/changed files when exporting so that your repository only reflects the changes.

Important flags for change management:

```
-skipExportDate -expOriginalIds -split
```

```
SQL> lb update -changelog f101.xml
```

To install the single file

```
SQL> lb update -changelog controller.xml
```

To install multiple files

Export will have new ids and dates

Shows up as changes in git repo

SQLcl and Liquibase: APEX

```
SQL> lb genobject -type apex -applicationid 101
```

Creates a single f101.xml file for your application

```
SQL> lb genobject -type apex -applicationid 101 -split
```

Creates multiple folders/files per component and an install file (like with the database)

NOTE: Liquibase will only update the new/alterd files when exporting so that your repository only reflects the changes.

Important flags for change management:

```
-skipExportDate -expOriginalIds -split
```

```
SQL> lb update -changelog f101.xml
```

To install the single file

```
SQL> lb update -changelog controller.xml
```

To install multiple files

Without these changes management becomes difficult

SQLcl and Liquibase: APEX

```
SQL> lb genobject -type apex -applicationid 101
```

Creates a single f101.xml file for your application

```
SQL> lb genobject -type apex -applicationid 101 -split
```

Creates multiple folders/files per component and an install file (like with the database)

NOTE: Liquibase will only update the new/changed files when exporting so that your repository only reflects the changes.

Important flags for change management:

```
-skipExportDate -expOriginalIds -split
```

```
SQL> lb update -changelog f101.xml
```

To install the single file

```
SQL> lb update -changelog controller.xml
```

To install multiple files

Liquibase can identify:

- What changed and what didn't change
- Push to git repository only those that changed

SQLcl and Liquibase: APEX

```
SQL> lb genobject -type apex -applicationid 101
```

Creates a single f101.xml file for your application

```
SQL> lb genobject -type apex -applicationid 101 -split
```

Creates multiple folders/files per component and an install file (like with the database)

NOTE: Liquibase will only update the new/alterd files when exporting so that your repository only reflects the changes.

Important flags for change management:

```
-skipExportDate -expOriginalIds -split
```

```
SQL> lb update -changelog f101.xml
```

To install the single file

```
SQL> lb update -changelog controller.xml
```

To install multiple files

Track:

- Accountability
- Following security standards
- Following coding standards

SQLcl and Liquibase: APEX

```
SQL> lb genobject -type apex -applicationid 101
```

Creates a single f101.xml file for your application

```
SQL> lb genobject -type apex -applicationid 101 -split
```

Creates multiple folders/files per component and an install file (like with the database)

NOTE: Liquibase will only update the new/alterd files when exporting so that your repository only reflects the changes.

Important flags for change management:

```
-skipExportDate -expOriginalIds -split
```

```
SQL> lb update -changelog f101.xml
```

To install the single file

```
SQL> lb update -changelog controller.xml
```

To install multiple files

Pipeline:

- Get and setup environment
- Apply new database objects
- Instal APEX app into the environment

SQLcl and Liquibase: Table Data

What about data???

You can pull data using **Liquibase**

Not meant for huge amount of data

ORDS used to move data

Use **data pump** for huge amount of data

SQLcl and Liquibase: Table Data

Liquibase export is great for Metadata tables

Table has only few hundred rows

```
SQL> lb data -object TABLE_NAME, TABLE_NAME...
```

Exports the data from the indicated table(s)

```
SQL> lb update -changelog data.xml
```

Imports the data into the table(s)

Best for Metadata tables
or smaller tables

Terraform and OCI

Terraform and OCI

Terraform can be used to:

- Build OCI infrastructure
- Modify OCI infrastructure
- Version OCI infrastructure

Terraform and OCI

```
resource "oci_database_autonomous_database" "new_autonomous_database" {  
  #Required  
  compartment_id = var.compartment_ocid  
  cpu_core_count = "1"  
  data_storage_size_in_tbs = "1"  
  db_name = "TESTDB${random_string.db_name.result}"  
  admin_password = random_string.password.result  
  db_workload = "OLTP"  
  display_name = "TESTDB${random_string.db_name.result}"  
}
```

Terraform and OCI

OCI CLI and Terraform can be used to
create VMs and other OCI resources

Terraform and OCI

Autonomous Database:

- Pay for it by the second you use
- Very helpful for testing purpose
